The **Infant/Toddler Program** is designed to evaluate and assist if needed, the patient's neurologic development. The nervous system is an inhibitory system, so as the infant/toddler develops, certain motor responses should be inhibited. When these responses are present, it is an early sign that proper maturation of the nervous system is not

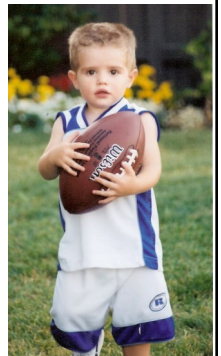

occurring, which may lead to later conditions, such as *learning difficulties, poor coordination, social-behavior disorders or sensory processing disorders*. The Infant/Toddler Program encompasses functional neurology exercises, specifically designed for the Infant/Toddler's needs, which will stimulate the nervous system and enhance development. The treatment in this program is often incorporated in other treatment programs such as the **Athletic Enhancement Program**, and/or the **BrainBased Learning Program**.

PROGRAM GOALS

- To identify and assist infants and toddlers with the development of their nervous system
- To have the infants and toddlers be developmentally ready for school and extracurricular activities
- To improve hand/eye coordination and enhance future athletic performance of our patients.
- To enhance the quality of life of the infant/toddler and their family
- To identify and correct muscle imbalance

PROGRAM DETAILS

This program is designed so that the infant or toddler is evaluated multiple times throughout the year. Once the evaluation has been performed, Dr. Slone or a trained staff member will provide the parent with the appropriate functional exercises to be performed while at home. A re-evaluation will be scheduled and the process is repeated, each time receiving exercises appropriate for the patient.
